

VETERINARY TECHNICAL DATASHEET

Pyruvate Dehydrogenase Phosphatase 1 (PDP1) Deficiency

Mutation Found In :Clumber Spaniel, Sussex Spaniel

Disorder Type

- Metabolic

Disease Severity

- Mild/moderate

Background

Pyruvate dehydrogenase phosphatase 1 (PDP1) deficiency is an inherited metabolic disorder encountered in the Clumber Spaniel and the Sussex Spaniel. This disorder is due to a deficit of the PDP1 enzyme which is normally involved in the activation of the pyruvate dehydrogenase complex in cellular metabolism. The disorder is inherited as an autosomal recessive trait.

Key Signs

- Exercise intolerance
- Lactic acidosis

Clinical Description

PDP1 deficiency affects the energy metabolism of the muscles. Physical exercise causes lactic acid build up leading to low blood pH and lactic acidosis. Affected dogs suffer from exercise intolerance and they may collapse during physical activity. Affected dogs can ease the symptoms of PDP1 deficiency by resting. The exercise intolerance is usually detected in the first year of a dog's life.

Mode of Inheritance

- autosomal recessive

Gene Name

- PDP1

Next Steps

Therapy is limited to symptomatic treatments and general supportive care. There is no cure.
